Acknowledgement

We sincerely appreciate the efforts of industry, energy auditors, equipment manufacturers, technology providers, consultants and other experts in the area of energy conservation for joining hands with Bureau of Energy Efficiency (BEE), Ministry of Power, and Government of India for preparing the Detailed Project Report (DPR) under BEE SME Program in SMEs clusters. We appreciate the support of suppliers/vendors for providing the adoptable energy efficient equipments/technical details to the SMEs.

We have received very encouraging feedback for the BEE SME Program in various SME Clusters. Therefore, it was decided to bring out the DPR for the benefits of SMEs. We sincerely thank the officials of BEE, Executing Agencies and ISTSL for all the support and cooperation extended for preparation of the DPR. We gracefully acknowledge the diligent efforts and commitments of all those who have contributed in preparation of the DPR.

EXECUTIVE SUMMARY

SEE-Tech Solution Pvt. Ltd. is executing BEE-SME program in Morbi Ceramic Cluster, supported by Bureau of Energy Efficiency (BEE) with an overall objective of improving the energy efficiency in cluster units.

Morbi cluster is one of the largest ceramic clusters in India; accordingly this cluster was chosen for energy efficiency improvements by implementing energy efficient measures/technologies, so as to facilitate maximum replication in other ceramic clusters in India. The main energy forms used in the cluster units are grid electricity, Natural gas, charcoal, lignite and small quantity of diesel oil.

In tile manufacturing industry, grinded raw material is dried in a spray dryer and stored in silos. After that, this material is sent through conveyor belt to the hydraulic press for formation of ceramic raw tiles. A hydraulic press is a machine using a hydraulic cylinder to generate a compressive force. A fluid such as oil is used to generate the required pressure for formation of tiles. Press is having about 8 to 10 strokes per minute. Press in the ceramic industry is the most fluctuating load.

Variable Frequency Drive is an innovative feature for hydraulic press that significantly decreases electricity consumption. VFD controlling the frequency of electrical power supplied to the motor and cuts down on unwarranted energy expenditures while maintaining full functionality. Other benefits of the VFD include the ability to program pressing speeds without the expense of proportional valves, and reduced noise & heat levels during idle periods.

This DPR highlights the energy, environment, economic and social benefits of use of variable frequency drives on hydraulic press in tiles manufacturing industry.

Total investment required and financial indicators calculated such as debt equity ratio, monetary saving, IRR, NPV, DSCR and ROI etc for proposed technology is furnished in Table below:

| S.No | Particular | Unit | Value |
|-------------|-----------------------|-------------|--------------|
| 1 | Project cost | ₹(in lakh) | 3.64 |
| 2 | Electricity saving | kWh/year | 40524 |
| 3 | Monetary benefit | ₹(in lakh) | 1.56 |
| 4 | Debit equity ratio | ratio | 3:1 |
| 5 | Simple payback period | years | 2.33 |
| 6 | NPV | ₹(in lakh) | 0.52 |
| 7 | IRR | %age | 15.93 |

| S.No | Particular | Unit | Value |
|-------------|-------------------|-------------|--------------|
| 8 | ROI | %age | 31.78 |
| 9 | DSCR | ratio | 1.54 |
| 10 | Process down time | days | 1 |

The projected profitability and cash flow statements indicate that the installation of VFD on hydraulic press is financially viable and technically feasible solution.

ABOUT BEE'S SME PROGRAM

Bureau of Energy Efficiency (BEE) is implementing a BEE-SME Programme to improve the energy performance in 25 selected SMEs clusters. Morbi Ceramic Cluster is one of them. The BEE's SME Programme intends to enhance the energy efficiency awareness by funding/subsidizing need based studies in SME clusters and giving energy conservation recommendations. For addressing the specific problems of these SMEs and enhancing energy efficiency in the clusters, BEE will be focusing on energy efficiency, energy conservation and technology up-gradation through studies and pilot projects in these SMEs clusters.

Major activities in the BEE -SME program are furnished below:

Energy use and technology audit

The energy use technology studies would provide information on technology status, best operating practices, gaps in skills and knowledge on energy conservation opportunities, energy saving potential and new energy efficient technologies, etc for each of the sub sector in SMEs.

Capacity building of stake holders in cluster on energy efficiency

In most of the cases SME entrepreneurs are dependent on the locally available technologies, service providers for various reasons. To address this issue BEE has also undertaken capacity building of local service providers and entrepreneurs/ Managers of SMEs on energy efficiency improvement in their units as well as clusters. The local service providers will be trained in order to be able to provide the local services in setting up of energy efficiency projects in the clusters

Implementation of energy efficiency measures

To implement the technology up-gradation project in the clusters, BEE has proposed to prepare the technology based detailed project reports (DPRs) for a minimum of five technologies in three capacities for each technology.

Facilitation of innovative financing mechanisms for implementation of energy efficiency projects

The objective of this activity is to facilitate the uptake of energy efficiency measures through innovative financing mechanisms without creating market distortion

1 INTRODUCTION

1.1 Brief Introduction about cluster

Morbi SME Cluster is one of the largest ceramic clusters in India and mainly famous for manufacturing of ceramic tiles. Over 70% of total ceramic tiles product comes from Morbi cluster. This cluster is spread over a stretch of about 10km on the Morbi–Dhuva Highway.

There are approximately 479 ceramic units in this cluster which are engaged in manufacturing of wall tiles, vitrified tiles, floor tiles, sanitary wares, roofing tiles and others product. There are around 50 more ceramic units coming up in Morbi cluster.

Primary raw materials required for manufacturing of tiles are various types of clay, quartz, calcite/wool astonite, frits & Glazes. Most of the raw materials are easily available in Gujarat and in the neighboring state of Rajasthan. Some of the units use raw material produced at another plant. The main reason for growth of ceramic cluster in Morbi is easy availability of raw material viz; clay suitable for ceramic tiles.

The main form of energy used by the cluster units are grid electricity, Natural Gas, charcoal, lignite, and diesel oil. Major consumptions of energy are in the form of Natural Gas and lignite. Details of total energy consumption at Morbi ceramic cluster are furnished in Table 1.1 below:

Table 1.1 Details of annual energy consumption

| S. No | Type of Fuel | Unit | Value | % contribution |
|-------|--------------|------------|-------------|----------------|
| 1 | Electricity | GWh/year | 1,200 | 8.23 |
| 2 | Natural Gas | SCM/year | 660,000,000 | 46.32 |
| 3 | Charcoal | tonne/year | 165,000 | 8.55 |
| 4 | Lignite | tonne/year | 1,320,000 | 36.84 |
| 5 | Diesel | litre/year | 800,000 | 0.06 |

Classification of Units

The ceramic units can be broadly categorized into four types based on product manufactured

- Floor tiles unit
- Sanitary ware unit
- Vitrified tiles unit
- Wall tiles unit

Further the ceramic cluster is classified into three type based on capacity of unit viz small scale, medium scale and large scale unit.

Products Manufactured

There are many types of ceramic product manufactured from four different types of units. Details of product manufactured and number of units engaged in manufacturing of such products are given in Table 1.2 below:

Table 1.2 Details of types of product manufactured

| S. No | Type of Product | No. of unit | %age share |
|-------|--|-------------|------------|
| 1 | Wall Tiles | 178 | 37 |
| 2 | Vitrified Tiles | 36 | 8 |
| 3 | Floor Tiles | 52 | 11 |
| 4 | Sanitary Wares | 43 | 9 |
| 5 | Spray dryer Mud manufacturing | 40 | 8 |
| 6 | Roofing Tiles (seasonal operation) | 120 | 25 |
| 7 | Third firing manufacturing (Producing pictures on tiles) | 10 | 2 |
| 8 | Total | 479 | |

Capacity wise production

Capacity wise production breakup is furnished in Table 1.3 below:

Table 1.3 Production wise unit breakups

| Type of product | No. of Units. | | | | Production (m ² /day or MT ^a /day) | | | |
|-----------------|---------------|--------|-------|-----------------|--|--------|--------|--------|
| | Small | Medium | Large | Total | Small | Medium | Large | Total |
| Wall Tiles | 43 | 100 | 35 | 178 | 2,500 | 3,500 | 7,500 | 13,500 |
| Floor Tiles | 8 | 38 | 6 | 52 | 3,000 | 4,000 | 7,000 | 14,000 |
| Vitrified Tiles | NA | 22 | 4 | 26 ^b | NA | 5,760 | 11,520 | 17,280 |
| Sanitary Wares | 10 | 24 | 9 | 43 | 4 | 8 | 14 | 26 |

^a-In case of sanitary wares, production is measured in MT.

^b-During audit no SSI vitrified tiles units were covered, therefore production data are not available for these units.

Energy usages pattern

Average monthly electricity consumption in ceramic unit ranges from 1 lakh to 2 lakh kWh depending on the size of the unit. In thermal energy, solid fuel such as lignite, charcoal, Indonesian coal, briquette, etc are used in spray dryer and natural Gas is used in kiln in all almost all units. Solid fuel consumption in spray dryer ranges from 80 to 160 kg/MT and. natural Gas consumption in kiln varies from 1.01 to 1.4 SCM/m² of tiles produced.

General production process for ceramic cluster

The units of Morbi ceramic cluster are involved in the manufacturing of 4 different types of products such as floor tiles, wall tiles, vitrified tiles and sanitary wares. Production process for manufacture of wall, floor and vitrified tiles is nearly the same except some differences in process parameters while the manufacturing process of sanitary wares inter alia involves manual moulding whereas in case of tiles, press is used to form the biscuits. General production processes for manufacturing of ceramic products is are following:

Wet Grinding

The raw material such as clay, feldspar, quartz, calcite etc. are mixed with water in a proper proportion and grind in a ball mill to make homogeneous mixture. Ball Mill is a batch type of process. After completion of one batch of ball mill, slurry is sent to the underground tanks containing the agitator motor in each tank to maintain the uniformity of mixture. Mainly blungers are used for mixing and grinding in case of wall and floor tiles, while ball mills are used for grinding in case of vitrified tiles.

Spray Drying

After preparation of slurry of required density it is stored in the underground tanks in which it is agitated to maintain uniformity of slurry. The slurry is then pumped through a hydraulic pump into the spray dryer where it is sprayed through nozzles. The material is dried in spray dryer to remove the moisture added during the grinding process in a ball mill. The moisture in the raw material is brought down to about 5–6 % from 35-40%. The product from spray dryer is stored in silos. Hot flue gases at a temperature of about 550 – 600 °C is used as the heating source which is generated by combustion of lignite, Indonesian coal, saw dust, briquette, natural gas etc.

Pressing/Moulding

The product from spray dryer is then sent to the press section which is pneumatically operated where the required sizes of biscuit tiles are formed. In case of sanitary ware manual moulding is carried out by hand held hose.

Drying

After pressing/moulding products containing about 5–6% moisture is dried to about 2–3% moisture in a dryer. In some units, hot air from kiln cooling zone exhaust is used in dryers and additional fuel firing is provided if required whereas in case of wall and floor tiles, fuel firing is done continuously.

Glazing

After drying, biscuit tiles are send for glazing on a glaze line. Glaze is prepared in ball mills. Glazing is required for designing on tiles. In case of sanitary ware the dried wares are glazed in several spray glazing booths, where compressed air is used.

Firing and Baking

After glazing product are then sent for final firing in kiln where temperature of 1100-1150 °C is maintained in the kiln. Natural gas is used for combustion in kiln. In some units hot air from gasifier is utilized for combustion.

Sizing

Tiles coming out of kiln are sent for sizing and calibration in case of wall and floor tiles. The tiles are cut in proper sizes so that all tiles have similar dimensions. After sizing the finished product is ready for dispatch.

Polishing

Polishing is required for vitrified tiles. It utilizes 40-45% of total electricity consumption of plant. After kiln the vitrified tiles are passed through polishing line. Polishing line consist of sizing, calibration and polishing machines.

General production process flow diagram for manufacturing of ceramic product is shown in Figure 1.1.

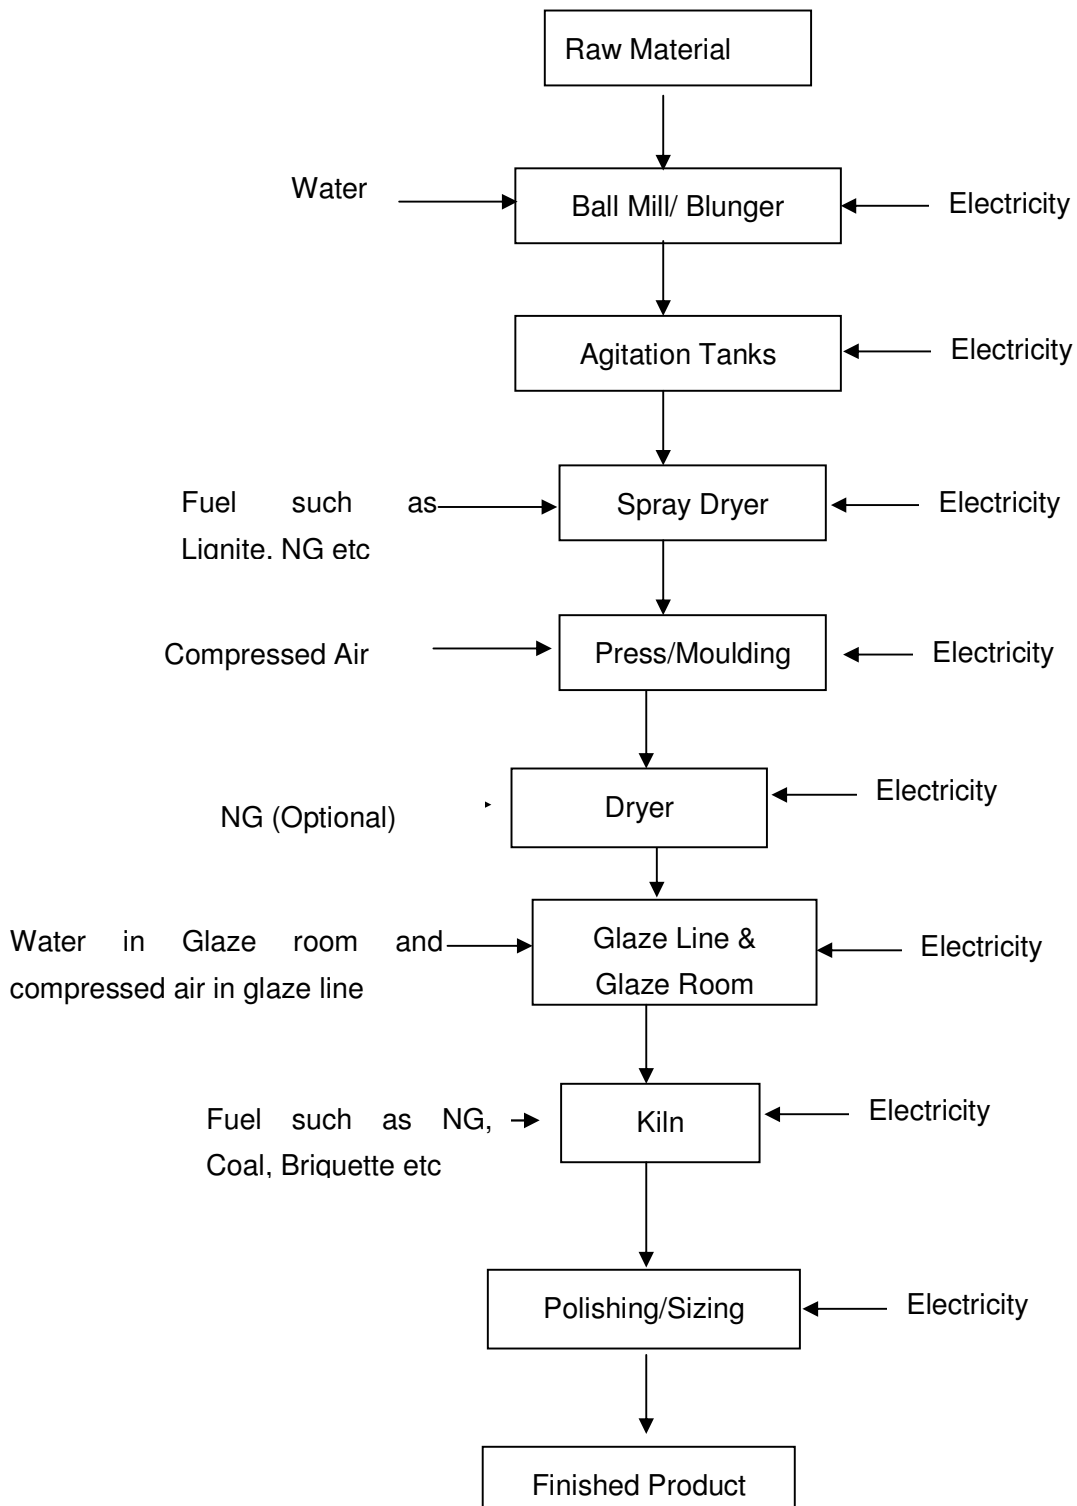

Figure 1.1 Process flow diagram

1.2 Energy performance in existing system

1.2.1 Fuel consumption

Average fuel and electricity consumption in a typical ceramic unit is given in Table 1.4 below:

Table 1.4 Average fuel and electricity consumption

| Energy | Electricity (MWh per year) | | | Natural gas (SCM per year) | | | Solid Fuel [lignite] (Tonne per year) | | |
|-----------------|-------------------------------|--------|-------|-------------------------------|-----------|-----------|--|--------|-------|
| | Small | Medium | Large | Small | Medium | Large | Small | Medium | Large |
| Wall Tiles | 900 | 1500 | 2400 | 750,000 | 1,050,000 | 2,250,000 | 2,400 | 2,880 | 3,600 |
| Floor Tiles | 900 | 1500 | 2400 | 900,000 | 1,200,000 | 2,100,000 | 3,600 | 4,200 | 4,800 |
| Vitrified Tiles | NA | 6000 | 12000 | NA | 2,700,000 | 6,000,000 | NA | 6,000 | 9,000 |
| Sanitary Wares | 2400 | 450 | 900 | 120,000 | 240,000 | 420,000 | NA | NA | NA |

1.2.2 Average annual production

Annual production in terms of m² per year is taken in case of tiles and in terms of MT per year in case of sanitary wares is given in the following Table 1.5 below:

Table 1.5 Average annual production

| S. No. | Type of Industry | Production (m ² /year) or MT/year | | |
|--------|------------------|--|--------------|-------------|
| | | Small scale | Medium scale | Large scale |
| 1 | Vitrified Tiles | 750,000 | 1,050,000 | 2,250,000 |
| 2 | Wall Tiles | 900,000 | 1,200,000 | 2,100,000 |
| 3 | Floor Tiles | NA | 1,728,000 | 3,456,000 |
| 4 | Sanitary Wares | 1200 | 2400 | 4200 |

1.2.3 Specific energy consumption

Specific energy consumption both electrical and thermal energy per m² or MT of production for different type of ceramic products are furnished in Table 1.6 below:

Table 1.6 Specific energy consumption

| S. No. | Type of Industry | kWh/m ² or kWh/piece ^c | SCM/m ² or SCM/ piece ^c |
|--------|------------------|--|---|
| 1 | Vitrified Tiles | 3.71 - 5.01 | 1.51 - 3.11 |
| 2 | Wall Tiles | 0.61 - 2.47 | 0.68 - 1.65 |
| 3 | Floor Tiles | 1.51 - 1.92 | 1.28 - 1.8 |
| 4 | Sanitary Wares | 0.78 - 1.73 | 1.10 - 1.49 |

Equipment wise specific energy consumption

The specific energy consumption of the equipments used in the ceramic industry is given in Table 1.7 below wherever possible.

Table 1.7 Equipment wise specific energy consumption

| S.No | Equipment | Electrical energy | | Thermal energy | |
|------|------------------------------|------------------------|-------------|--------------------|-----------|
| | | Unit | Vale | Unit | value |
| 1 | Ball Mill/Blunger | kWh/MT | 4 -12 | | - |
| 2 | Agitation process | kWh/m ³ /hr | 0.2 - 0.8 | | - |
| 3 | Spray Dryer | - | - | kg/MT | 80 - 160 |
| 4 | Press | kWh/m ² | 0.22- 0.4 | | - |
| 5 | Dryer | kWh/m ² | 0.011 | SCM/m ² | 0 - 0.63 |
| 6 | Glaze line + Glaze ball mill | kWh/MT | 2 - 9 | | - |
| 7 | Kiln | kWh/m ² | 0.36 - 1.26 | SCM/m ² | 1.01 -1.4 |
| 8 | Polishing line/sizing | kWh/m ² | 1.74 - 2.35 | | - |

^c In sanitary ware production is measured in term of pieces only.

1.3 Existing technology/equipment

1.3.1 Description of existing technology

In tile manufacturing industry, grinded raw material is dried in a spray dryer containing about 4 to 5 % moisture in the output product. Then dried material from spray dryer is stored in silos. After that, dried material is then sent through conveyor belt to the hydraulic press for formation of ceramic raw tiles. A hydraulic press is a machine using a hydraulic cylinder to generate a compressive force. A fluid such as oil is used to generate the required pressure for formation of tiles. Press is having about 8 to 10 strokes per minute. Hydraulic press in the ceramic industry have most fluctuating load.

1.3.2 Role in process

Product from the spray dryer is sent to the hydraulic press where the required sizes of biscuit tiles are formed by pressing the material and sent to dryer through conveyor for final baking.

1.4 Baseline establishment for existing technology

1.4.1 Design and operating parameters

Electricity consumption of the hydraulic press is given in Table 1.8 below:

Table 1.8 Electricity consumption in press

| S. No. | Equipment | Unit | Value |
|--------|-----------|----------|----------|
| 1 | Press | kWh/year | 8,59,694 |

1.4.2 Specific electricity consumption

Specific electrical energy consumption in hydraulic press is given in Table 1.9 below and further specific energy consumption in presses for different unit is determined and is given in Annexure 1.

Table 1.9 Specific electricity consumption in hydraulic machine

| S. No. | Equipment | Unit | Value |
|--------|-----------|--------------------|-------|
| 1 | Press | kWh/m ² | 0.23 |

1.5 Barriers in adoption of proposed equipment

1.5.1 Technological barrier

In Morbi cluster, overall technical understanding on ceramic manufacturing is good and rapidly increasing. Important equipments like kiln, polishing machine and hydraulic machine etc are bought from Italy (Sacmi) and China (Modena), which are leading suppliers of these equipments world wide. Many of the unit owners are frequently visiting international ceramic fairs and ceramic process equipment suppliers, thus keeping them informed. It has been observed that at cluster level there is committed interested for leadership and following up is quick. In general, there is readiness to adopt provided delivery, outcome and results are demonstrated.

However the first change is still a challenge, upon success, later on duplication and adaptation is extremely prevalent in the cluster. The technologies need to be demonstrated within the cluster. While carrying out the audits and presenting the Energy audit reports to the units, in the discussion with the plant owners & other personnel, many of them agreed with many of the identified energy saving measures and technologies but they demanded demonstration of the energy saving technologies in any plant and thereafter they have readiness to follow.

1.5.2 Financial barrier

Availing finance is not the major issue. Among the SMEs, the larger units, if convinced are capable of either financing it themselves or get the finance from their banks. The smaller units will require competitive loan and other support to raise the loan. However as most of them have been able to expand their setup and grow, there is readiness to spend for energy efficiency technologies which have good returns. Energy Efficiency Financing Schemes such as SIDBI's, if focused on the cluster, will play a catalytic role in implementation of identified energy conservation projects & technologies.

1.5.3 Skilled manpower

In Morbi ceramic cluster, the availability of skilled manpower is one of the problems due to more number of units. One local technical persons available at Morbi takes care of about 5-10 ceramic units. Maintenance or repair work of major equipments of ceramic units like kiln, hydraulic machine etc, are generally taken care by the equipment suppliers itself as they station one of their experienced technical representative at Morbi for the maintenance work.

Specialized and focused training of the local service providers on better operation and maintenance of the equipments, importance of the energy and its use and energy conservation

measures will improve awareness among the unit owners and workforce. Original equipment suppliers should also participate in these programs.

1.5.4 Other barrier (If any)

Many of the new technology provider's (especially some foreign technology leaders) have not shown keen interest in implementation of their new innovative technologies. This appears to be because of fear of duplication.

2. PROPOSED EQUIPMENT FOR ENERGY EFFICIENCY IMPROVEMENT

2.1 Description of proposed equipment

2.1.1 Detailed of proposed equipment

VFD is an innovative feature for hydraulic press that significantly increases energy efficiency over traditional hydraulic & mechanical presses motors. VFD controls the frequency of electrical power supplied to the motor according to the load requirement, which drastically cuts down on unwarranted energy expenditures while maintaining full functionality. Besides these benefit other benefits of the VFD include the ability to program pressing speeds without the expense of proportional valves, and reduced noise & heat levels during idle periods.

2.1.2 Equipment/technology specification

INVERTER - D -700 - Three Phase Drive (I/P 400 V 3 ϕ , O/P 400 V 3 ϕ)

Flux Vector Control with In-Built Brake Unit 150% O/L for 60 sec. & 200% O/L for 0.5 sec.

Other equipment details are mentioned in quotation shown in Annexure 8.

2.1.3 Integration with existing equipment

For implementation of this project, we have to design one circuit system where we put the variable frequency on the motor of the hydraulic press so that the speed can be varying according to the requirement.

This technology has been selected because of the following reasons

- More load fluctuation in hydraulic press
- Results are already seen in few ceramic industries where this project is implemented and in operation.
- It results in reduction in GHG emissions

2.1.4 Superiority over existing system

Installation of VFD reduces electricity consumption as well as increase life of the system. It also provides flexibility in pressing speed without any expenses.

2.1.5 Source of equipment

This technology is already in use in few ceramic industries at Morbi. These units practically observed the savings achieved after implementation of this project in their plant.

2.1.6 Availability of technology/equipment

As Gujarat is the major hub of industrial units, VFD can be easily available at Morbi itself. Most of the persons located at Morbi deals in supply of VFD.

2.1.7 Service providers

Details of technology service providers are shown in Annexure 7.

2.1.8 Terms and conditions in sales of equipment

Warranty period of one year from the date of invoice against any manufacturing defects will be provided. Further details of term and condition are provided in Annexure 8.

2.1.9 Process down time

Process down time required for installation of VFD on hydraulic press will be of 1 day.

2.2 Life cycle assessment and risks analysis

Life of the equipment is about 10 years. Risk involves in the installation of proposed project are as follows:

- Lack of initiative of the unit owner
- Fear of affecting the quality of product because of replacement.
- Availability of skilled manpower in industry

2.3 Suitable unit for Implementation of proposed technology

Suitable unit for implementation of this technology has been selected which engage in manufacturing of floor tiles having the production capacity of about 5112 m² per day and one hydraulic press of rated capacity of main motor about 90 kW.

3. ECONOMIC BENEFITS FROM PROPOSED TECHNOLOGY

3.1 Technical benefit

3.1.1 Fuel saving

Implementation of this project does not resulting in reduction in fuel consumption in ceramic industry.

3.1.2 Electricity saving

Implementation of this project results about 15% saving in electricity of present electricity consumption in hydraulic press. Presently electricity consumption in hydraulic press is 2,70,158 kWh per year hence installation of this project will save about 40524 kWh of electricity per year.

3.1.3 Improvement in product quality

Product quality achieved would be same as in the present quality. It does not have any impact on the improvement in the quality of the product.

3.1.4 Increase in production

Implementation of this project will not lead to any increase in production.

3.1.5 Reduction in raw material

Raw material consumption is same even after the implementation of proposed technology.

3.1.6 Reduction in other losses

Reduce wear and tear loss in machine due to reduction in speed of motor during unloading period.

3.2 Monetary benefits

Implementation of proposed project saves about 40524 kWh of electricity per year hence total monetary benefit is ₹ 1.56 lakh per year. Detail of monetary saving is furnished in table 3.1 below:

Table 3.1 Energy and monetary benefit

| S.No | Parameter | Unit | Value |
|------|---|-----------|--------|
| 1 | Present electricity consumption in a unit | kWh/year | 270158 |
| 2 | Electricity consumption after project implemented | MWh/year | 229634 |
| 3 | Total working days | days/year | 330 |

| S.No | Parameter | Unit | Value |
|------|--------------------------|----------------|-------|
| 4 | Total operating hours | hr/days | 24 |
| 3 | Total electricity saving | kWh/year | 40524 |
| 5 | Cost of electricity | ₹ /kWh | 3.85 |
| 6 | Total monetary benefit | ₹ in lakh/year | 1.56 |

Further details of total monetary benefit are given in Annexure 3.

3.3 Social benefits

3.3.1 Improvement in working environment

No improvement on the working environment in the plant.

3.3.2 Improvement in workers skill

Technical skills of persons will definitely be improved. As the training will be provided by equipment suppliers which improve the technical skills of manpower required for operating of the equipment and also the technology implementation will create awareness among the workforce about energy efficiency and energy saving.

3.4 Environmental benefits

3.4.1 Reduction in effluent generation

There is no significant impact in effluent generation due to implementation of the project.

3.4.2 Reduction in GHG emission

Implementation of this project will result in saving of electricity consumption of about 40,524 kWh per year. This will leads to about 32 tCO₂ emission reduction per year from one ceramic unit. Similarly, there are about 400 ceramic tiles units at Morbi and implementation of this project in all the ceramic units will reduce the significant amount of CO₂ emissions per year. Hence proposed project can generate extra income though carbon credit.

3.4.3 Reduction in other emissions like SO_x

Significant amount of SO_x will be reducing due to decrease in electricity consumption.

4 INSTALLATION OF PROPOSED EQUIPMENT

4.1 Cost of project

4.1.1 Equipment cost

Total cost of VFD will be about ₹ 2.85 lakh.

4.1.2 Erection, commissioning and other misc. cost

Other cost includes cost of commissioning, implementation during implementation and man power cost contingency cost etc. Details of total project cost requires for implementation of proposed technology are furnished in Table 4.1 below:

Table 4.1 Details of proposed technology project cost

| S.No | Particular | Unit | Value |
|------|--------------------------------|-------------|-------|
| 1 | Cost of VFD equipment | ₹ (in lakh) | 2.85 |
| 2 | Erection & Commissioning cost | ₹ (in lakh) | 0.29 |
| 3 | Interest during implementation | ₹ (in lakh) | 0.08 |
| 4 | Taxes(VAT) | ₹ (in lakh) | 0.14 |
| 4 | Other misc. cost | ₹ (in lakh) | 0.29 |
| 5 | Total cost | ₹ (in lakh) | 3.64 |

4.2 Arrangements of funds

4.2.1 Entrepreneur's contribution

The total cost of the proposed technology is estimated at ₹ 3.64 lakh. The entrepreneur's contribution is 25% of total project cost, which is ₹ 0.91 lakh.

4.2.2 Loan amount.

The term loan is 75% of the total project cost, which is ₹ 2.73 lakh.

4.2.3 Subsidy by Government

As the overall energy efficiency in the project is more than 15% it qualifies for subsidy of 25 % of the project cost as per the NMCP scheme of Ministry of MSME, Gol. 25 % of the project cost in

this case works out to ₹ 0.91 lakh. As the subsidy is normally available after implementation of the project the same has not been taken in the project cost and means of finance. On receipt of subsidy from Ministry of MSME, Govt through the nodal agency the amount of subsidy is generally set off [reduced] from the loan outstanding by the lender bank. Availability of this subsidy will make the project economically more attractive.

4.2.4 Terms & conditions of loan

The interest rate is considered at 10% which is SIDBI's rate of interest for energy efficient projects. The loan tenure is 4 years excluding initial moratorium period is 6 months from the date of first disbursement of loan.

4.3 Financial indicators

4.3.1 Cash flow analysis

Profitability and cash flow statements have been worked out for a period of 5 years. The financials have been worked out on the basis of certain reasonable assumptions, which are outlined below.

The project is expected to achieve monetary savings of ₹ 1.56 lakh per year.

- The Operation and Maintenance cost is estimated at 5% of cost of total project with 3% increase in every year as escalations.
- Interest on term loan is estimated at 10%.
- Depreciation is provided as per the rates provided in the companies act.

Considering the above mentioned assumptions, net cash accruals starting with ₹ 0.95 lakh in the first year operation and gradually increases to ₹ 1.88 lakh at the end of sixth year.

4.3.2 Simple payback period

The total project cost of the proposed technology is ₹ 3.64lakh and monetary savings is ₹ 1.56 lakh hence the simple payback period works out to be 2.33 years.

4.3.3 Net Present Value (NPV)

The Net present value of the investment at 10% works out to be ₹ 0.52 lakh.

4.3.4 Internal rate of return (IRR)

The after tax internal rate of return of the project works out to be 15.93%. Thus the project is financially viable.

4.3.5 Return on investment (ROI)

The average return on investment of the project activity works out at 31.78%.

Details of financial indicator are shown in Table 4.2 below:

Table 4.2 Financial indicators of proposed technology/equipment

| S.No | Particulars | Unit | Value |
|------|------------------------|-------|-------|
| 1 | Simple Pay Back period | Month | 28 |
| 2 | IRR | %age | 15.93 |
| 3 | NPV | lakh | 0.52 |
| 4 | ROI | %age | 31.78 |
| 5 | DSCR | Ratio | 1.54 |

4.4 Sensitivity analysis

A sensitivity analysis has been carried out to ascertain how the project financials would behave in different situations like when there is an increase in fuel savings or decrease in fuel savings. For the purpose of sensitive analysis, two following scenarios has been considered

- Optimistic scenario (Increase in fuel savings by 5%)
- Pessimistic scenario (Decrease in fuel savings by 5%)

In each scenario, other inputs are assumed as a constant. The financial indicators in each of the above situation are indicated along with standard indicators.

Details of sensitivity analysis at different scenarios are shown in Table 4.3 below:

Table 4.3 Sensitivity analysis at different scenarios

| Particulars | DSCR | IRR | ROI | NPV |
|-----------------------------|------|--------|--------|------|
| Normal | 1.54 | 15.93% | 31.78% | 0.52 |
| 5% increase in fuel savings | 1.62 | 18.37% | 32.39% | 0.74 |
| 5% decrease in fuel savings | 1.46 | 13.46% | 31.11% | 0.30 |

4.5 Procurement and implementation schedule

Total procurement period for implementation of this technology requires 5 weeks and their details are shown in Annexure 6.

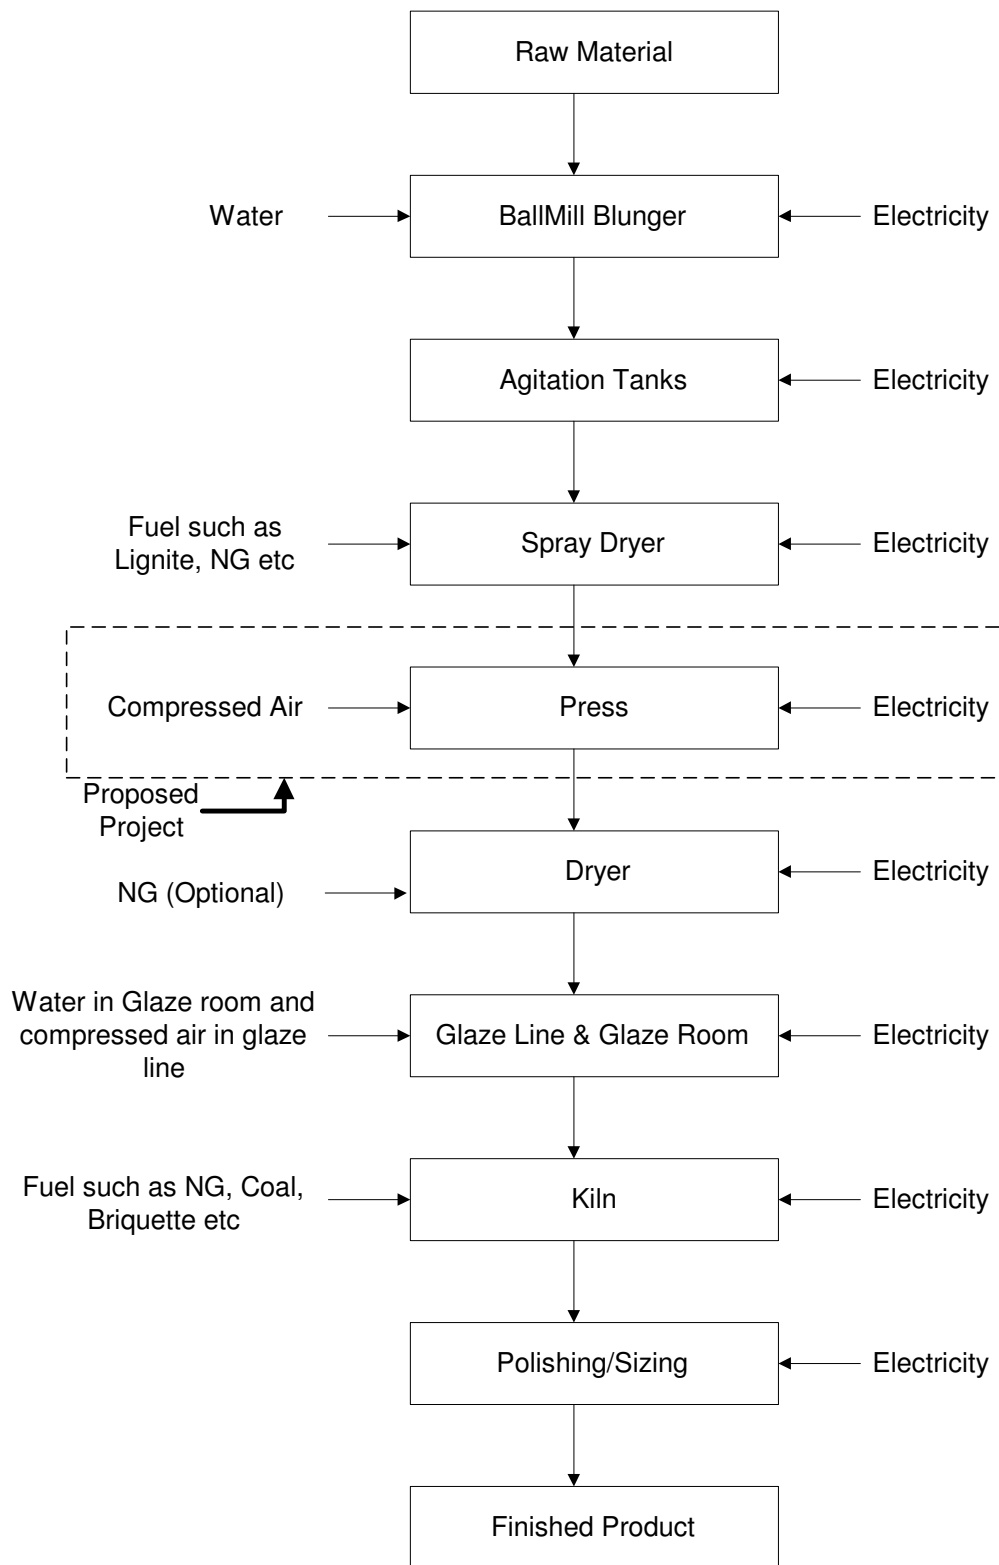

Annexure

Annexure -1: Energy audit data used for baseline establishment

Efficiency of the motor of press varies as the loading of the press motors is varying. Specific energy consumption of presses in different ceramic industries is given below.

| S. No. | Type of industry | Specific Electricity Consumption kWh/m ² | |
|--------|------------------|--|------|
| | | Min | Max |
| 1 | Wall Tiles | 0.18 | 0.53 |
| 2 | Floor Tiles | 0.21 | 0.41 |
| 3 | Vitrified Tiles | 0.44 | 0.58 |

Annexure -2: Process flow diagram after project implementation

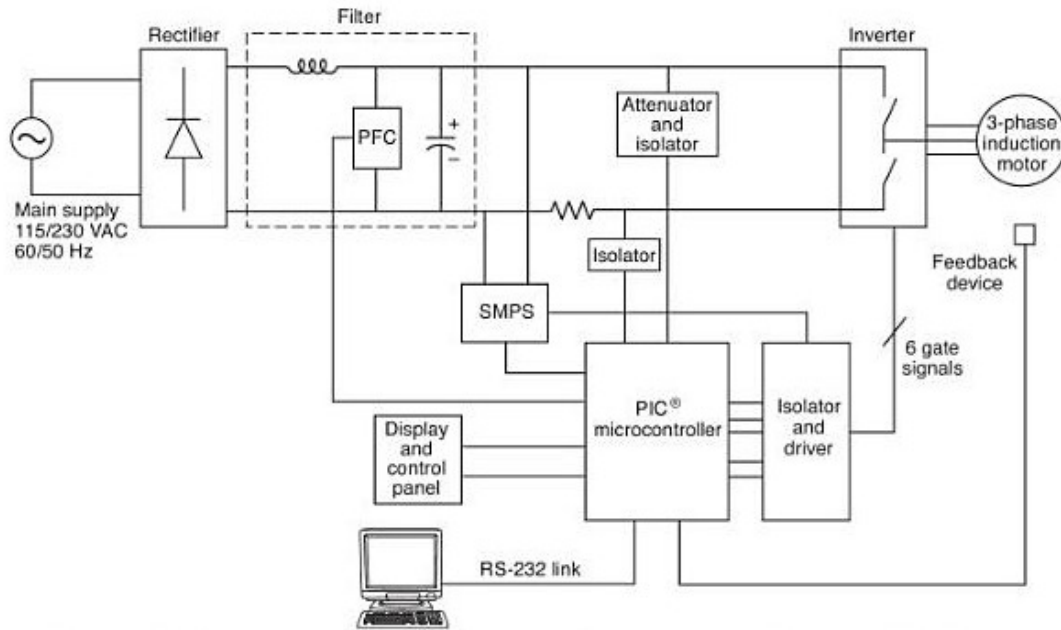

Annexure -3: Detailed technology assessment report

| Sr. No. | Particular | Unit | Existing Technology | Proposed Technology |
|----------------|--|--------------|----------------------------|----------------------------|
| 1 | Rated Capacity of main hydraulic motor of press | kW | 90 | 90 |
| 3 | Saving in electricity consumption after implementation of this project | %age | | 15 |
| 4 | Electricity Consumption in press | kWh/year | 2,70,158 | 2,29,634 |
| 5 | Working days in a year | days | 330 | 330 |
| 6 | Cost of electricity | ₹/kWh | 3.85 | 3.85 |
| 7 | Energy cost in press operation | ₹ lakh /year | 10.40 | 8.84 |
| 8 | Monetary Saving | kWh/year | | 40524 |
| 9 | Monetary Saving | ₹ lakh /year | | 1.56 |

Annexure -4 Drawings for proposed electrical & civil works

Detail diagram of functioning and connection of variable frequency drive is shown below.

Annexure -5: Detailed financial analysis**Assumption**

| Name of the Technology | VFD on Hydraulic press | | |
|--------------------------------|-------------------------------|--------------|----------------------|
| Rated Capacity | | | |
| Details | Unit | Value | Basis |
| Installed Capacity | | | Feasibility Study |
| No of working days | Days | 330 | Feasibility Study |
| No of Shifts per day | Shifts | 3 | Feasibility Study |

See-Tech Solution Pvt. Ltd.
 Nagpur, Maharashtra.

Kind Attn. : Mr. Milind Chittawar
Subject : Quotation for Mitsubishi makes AC Drives.

Respected Sir,

This has reference to our telephonic discussion for above-mentioned requirement.

We are please to introduce ourselves as System Integrator for **Mitsubishi / Messung Automation** products.

We hope our product is in line with your requirement and prices quoted are attractive.

| Mitsubishi AC Drive Price List | | | |
